Announcements

■ Lab 1 (datalab)

- Due Thurs, Sept. 17, 11:59pm ET

■ Written Assignment 1 peer grading

- Due Wed, Sept. 23, 11:59pm ET

■ Written Assignment 2 available on [Canvas](#)

- Due Wed, Sept. 23, 11:59pm ET

■ Lab 2 (bomblab) will be available at midnight via [Autolab](#)

- Due Tues, Sept. 29, 11:59 pm ET

■ Recitation on bomblab this Monday

- In person: you have been contacted with your recitation info
- Online: use the zoom links provided on the Canvas homepage

Add WeChat powcoder

Catching Up

- Reviewing LEAQ (based on after-class questions)
- Reviewing Arithmetic Expressions in ASM
- C -> Assembly -> Machine Code

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

LEA: Evaluate Memory Address Expression Without Accessing Memory

■ `leaq Src, Dst`

- `Src` is address computation expression \longrightarrow $D(Rb, Ri, S): \text{Reg}[Rb] + S * \text{Reg}[Ri] + D$
- Set `Dst` to address denoted by expression

Assignment Project Exam Help

■ Uses

<https://powcoder.com>

- Computing address/pointer **WITHOUT ACCESSING MEMORY**
 - E.g., translation of `p = &x[i];`
- Compute arbitrary expressions of form: $b + (s * i) + d$, where $s = 1, 2, 4, \text{ or } 8$
 - [also w/o accessing memory]

Add WeChat powcoder

■ Example

```
long m12(long x)
{
    return x*12;
}
```

Converted to ASM by compiler:

```
leaq (%rdi,%rdi,2), %rax    # t = x+2*x
salq $2, %rax               # return t<<2
```

LEA vs. other instructions (e.g., MOV)

■ `leaq D(Rb,Ri,S), dst`

- $dst \leftarrow \text{Reg}[Rb] + S * \text{Reg}[Ri] + D$
- *NO MEMORY ACCESS HAPPENS!*

Assignment Project Exam Help

<https://powcoder.com>

■ `movq D(Rb,Ri,S), dst`

- $dst \leftarrow \text{Mem}[\text{Reg}[Rb] + S * \text{Reg}[Ri] + D]$
- *MEMORY ACCESS HAPPENS!*

Add WeChat powcoder

Arithmetic Expression Example

```

long arith
(long x, long y, long z)
{
    long t1 = x+y;
    long t2 = z+t1;
    long t3 = x+4;
    long t4 = y * 48;
    long t5 = t3 + t4;
    long rval = t2 * t5;
    return rval;
}

```

arith:

```

leaq    (%rdi,%rsi), %rax
addq    %rdx, %rax
leaq    (%rsi,%rsi,2), %rdx
salq    $4, %rdx
leaq    4(%rdi,%rdx), %rcx
imulq   %rcx, %rax

```

ret

Interesting Instructions

- **leaq**: address computation
- **salq**: shift
- **imulq**: multiplication
 - Curious: only used once...

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

Understanding Arithmetic Expression

Example

```

long arith
(long x, long y, long z)
{
    long t1 = x+y;
    long t2 = z+t1;
    long t3 = x+4;
    long t4 = y * 48;
    long t5 = t3 + t4;
    long rval = t2 * t5;
    return rval;
}

```

```

arith:
    leaq    (%rdi,%rsi), %rax    # t1
    addq    %rdx, %rax          # t2
    leaq    (%rsi,%rsi,2), %rdx
    salq    $4, %rdx           # t4
    leaq    4(%rdi,%rdx), %rcx  # t5
    imulq   %rcx, %rax          # rval
    ret

```

Register	Use(s)
%rdi	Argument x
%rsi	Argument y
%rdx	Argument z , t4
%rax	t1, t2, rval
%rcx	t5

$D(Rb, Ri, S): \text{Mem}[\text{Reg}[Rb] + S * \text{Reg}[Ri] + D]$

Today: Machine Programming I: Basics

- History of Intel processors and architectures
- Assembly Basics: Registers, operands, move
- Arithmetic & logical operations
- **C, assembly, machine code**

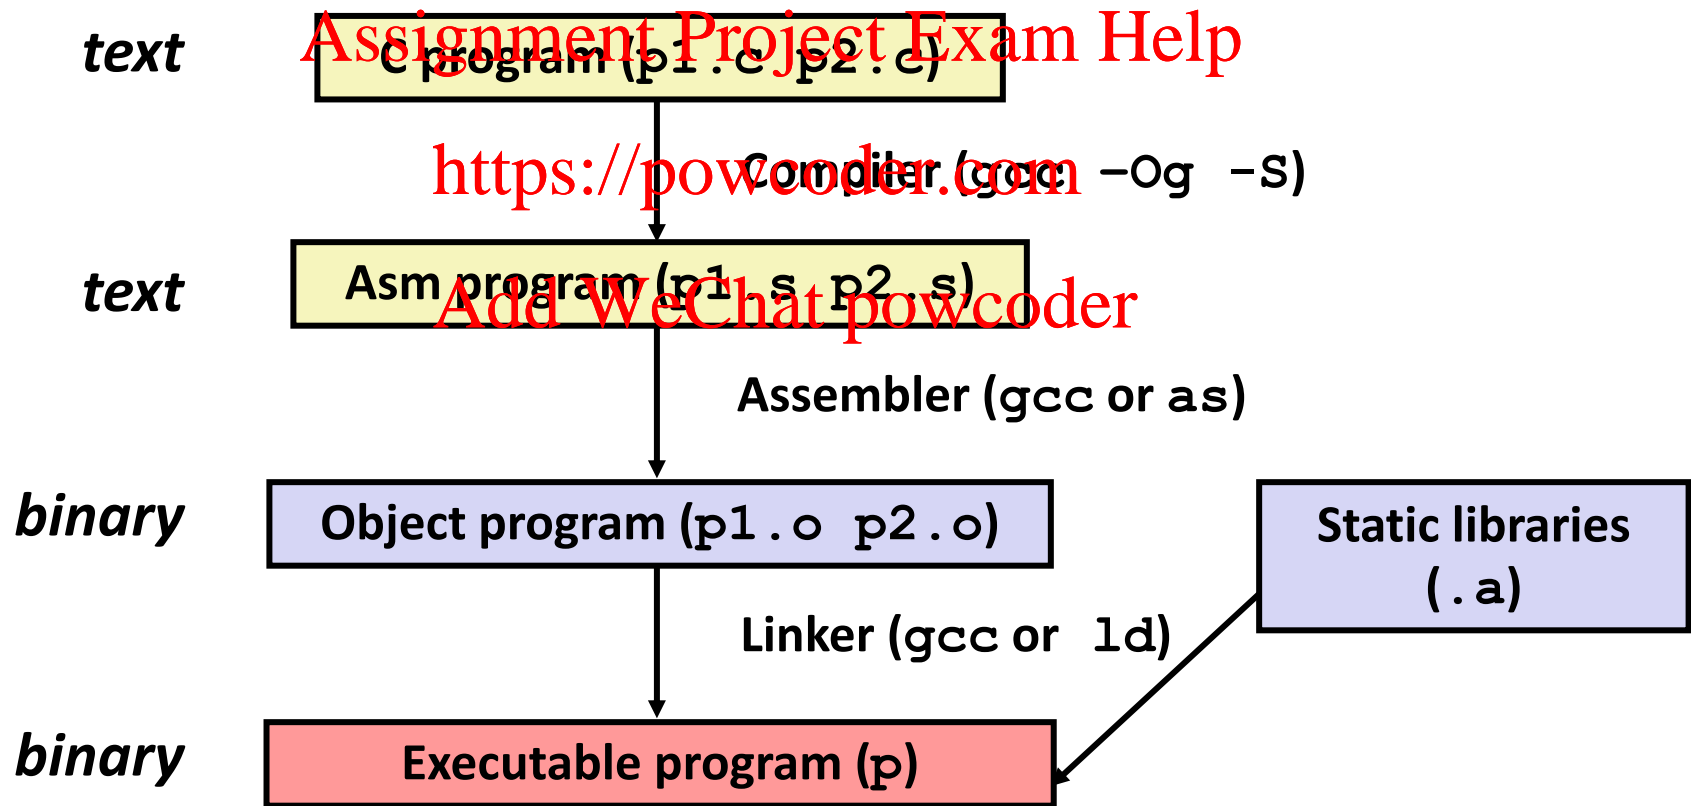

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

Turning C into Object Code

- Code in files `p1.c` `p2.c`
- Compile with command: `gcc -Og p1.c p2.c -o p`
 - Use basic optimizations (`-Og`) [New to recent versions of GCC]
 - Put resulting binary in file `p`

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

Compiling Into Assembly

C Code (sum.c)

```
long plus(long x, long y);

void sumstore(long x, long y,
              long *dest)
{
    long t = plus(x, y);
    *dest = t;
}
```

Generated x86-64 Assembly

```
sumstore:
    pushq    %rbx
    movq     %rdx, %rbx
    call     plus
    movq     %rax, (%rbx)
    popq     %rbx
    ret
```

Assignment Project Exam Help

<https://powcoder.com>

Obtain (on shark machine) with command

```
gcc -Og -S sum.c
```

Produces file `sum.s`

Warning: Will get very different results on non-Shark machines (Andrew Linux, Mac OS-X, ...) due to different versions of gcc and different compiler settings.

What it really looks like

```
.globl  sumstore
.type   sumstore, @function

sumstore:
.LFB35:
.cfi_startproc
pushq   %rbx
.cfi_def_cfa_offset 16
.cfi_offset 3, -16
movq    %rdx, %rbx
call    plus
movq    %rax, (%rbx)
popq    %rbx
.cfi_def_cfa_offset 8
ret
.cfi_endproc

.LFE35:
.size   sumstore, .-sumstore
```

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

What it really looks like

Things that look weird
and are preceded by a ‘
are generally directives.

```
.globl  sumstore
.type   sumstore, @function

sumstore:
.LFB35:

.cfi_startproc
pushq   %rbx
.cfi_def_cfa_offset 16
.cfi_offset 3, 16
movq    %rdx, %rbx
call    plus
movq    %rax, (%rbx)
popq    %rbx
.cfi_def_cfa_offset 8
ret
.cfi_endproc

.LFE35:

.size   sumstore, .-sumstore
```

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

```
sumstore:
pushq   %rbx
movq    %rdx, %rbx
call    plus
movq    %rax, (%rbx)
popq    %rbx
ret
```

Object Code

Code for `sumstore`

0x0400595:

0x53

0x48

0x89

0xd3

0xe8

0xf2

0xff

0xff

0xff

0x48

0x89

0x03

0x5b

0xc3

- **Total of 14 bytes**
- **Each instruction 1, 3, or 5 bytes**
- **Starts at address 0x0400595**

■ Assembler

- Translates `.s` into `.o`
- Binary encoding of each instruction
- Nearly-complete image of executable code
- Missing linkages between code in different files

<https://powcoder.com>

■ Linker

- Resolves references between files
- Combines with static run-time libraries
 - E.g., code for `malloc`, `printf`
- Some libraries are *dynamically linked*
 - Linking occurs when program begins execution

Assignment Project Exam Help

Add WeChat powcoder

Machine Instruction Example

```
*dest = t;
```

■ C Code

- Store value `t` where designated by `dest`

```
movq %rax, (%rbx)
```

■ Assembly

- Move 8-byte value to memory
 - Quad words in x86-64 parlance

■ Operands:

`t`: Register `%rax`

`dest`: Register `%rbx`

`*dest`: Memory `M[%rbx]`

```
0x40059e:  48 89 03
```

■ Object Code

- 3-byte instruction
- Stored at address `0x40059e`

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

Disassembling Object Code

Disassembled

```

0000000000400595 <sumstore>:
 400595:  53                      push    %rbx
 400596:  48 89 d3                mov     %rdx,%rbx
 400599:  e8 f2 ff ff ff         callq   400590 <plus>
 40059e:  48 89 03                mov     %rax, (%rbx)
 4005a1:  5b                      pop     %rbx
 4005a2:  c3                      retq

```

Add WeChat powcoder

■ Disassembler

`objdump -d sum`

- Useful tool for examining object code
- Analyzes bit pattern of series of instructions
- Produces approximate rendition of assembly code
- Can be run on either a `.out` (complete executable) or `.o` file

Alternate Disassembly

Disassembled

```

Dump of assembler code for function sumstore:
0x0000000000400595 <+0>: push    %rbx
0x0000000000400596 <+1>: mov     %rdx,%rbx
0x0000000000400599 <+4>: callq   0x400590 <plus>
0x000000000040059e <+9>: mov     %rax, (%rbx)
0x00000000004005a1 <+12>: pop     %rbx
0x00000000004005a2 <+13>: retq

```

Add WeChat powcoder

- **Within gdb Debugger**
 - Disassemble procedure
- ```

gdb sum
disassemble sumstore

```

Add WeChat powcoder

# Condition Codes (Implicit Setting)

## ■ Single bit registers

- **CF**      Carry Flag (for unsigned)      **SF** Sign Flag (for signed)
- **ZF**      Zero Flag      **OF** Overflow Flag (for signed)

Assignment Project Exam Help

## ■ Implicitly set (as side effect) of arithmetic operations

Example: `addq Src, Dest`  $\leftrightarrow$  `t = a+b`

**CF set** if carry/borrow out from most significant bit (unsigned overflow)

**ZF set** if `t == 0`

**SF set** if `t < 0` (as signed)

**OF set** if two's-complement (signed) overflow

`(a>0 && b>0 && t<0) || (a<0 && b<0 && t>=0)`

## ■ Not set by `leaq` instruction

<https://powcoder.com>

Add WeChat powcoder

# ZF set when

000000000000...000000000000

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

# SF set when

Add WeChat powcoder

For signed arithmetic, this reports when result is a negative number

# CF set when

For unsigned arithmetic, this reports overflow

# OF set when

Add WeChat  or powcoder

$(a > 0 \ \&\& \ b > 0 \ \&\& \ t < 0) \ || \ (a < 0 \ \&\& \ b < 0 \ \&\& \ t \geq 0)$

For signed arithmetic, this reports overflow

# Condition Codes (Explicit Setting: Compare)

## ■ Explicit Setting by Compare Instruction

- `cmpq Src2, Src1`
- `cmpq b, a` like computing  $a-b$  without setting destination

Assignment Project Exam Help

- **CF set** if carry/borrow out from most significant bit  
(used for unsigned comparisons)
- **ZF set** if  $a == b$
- **SF set** if  $(a-b) < 0$  (as signed)
- **OF set** if two's-complement (signed) overflow  
 $(a > 0 \ \&\& \ b < 0 \ \&\& \ (a-b) < 0) \ || \ (a < 0 \ \&\& \ b > 0 \ \&\& \ (a-b) > 0)$

<https://powcoder.com>

Add WeChat powcoder

# Condition Codes (Explicit Setting: Test)

## ■ Explicit Setting by Test instruction

- `testq Src2, Src1`
  - `testq b, a` like computing `a&b` without setting destination

Assignment Project Exam Help

- Sets condition codes based on value of `Src1` & `Src2`
- Useful to have one of the operands be a mask

<https://powcoder.com>

Add WeChat powcoder

- **ZF set** when `a&b == 0`
- **SF set** when `a&b < 0`

Very often:

```
testq %rax, %rax
```

# Condition Codes (Explicit Reading: Set)

## ■ Explicit Reading by Set Instructions

- **setX** *Dest*: Set low-order byte of destination *Dest* to 0 or 1 based on combinations of condition codes
- Does not alter remaining 7 bytes of *Dest*

| SetX  | Condition                            | Description               |
|-------|--------------------------------------|---------------------------|
| sete  | ZF                                   | Equal / Zero              |
| setne | $\sim ZF$                            | Not Equal / Not Zero      |
| sets  | SF                                   | Negative                  |
| setns | $\sim SF$                            | Nonnegative               |
| setg  | $\sim (SF \wedge OF) \ \& \ \sim ZF$ | Greater (signed)          |
| setge | $\sim (SF \wedge OF)$                | Greater or Equal (signed) |
| setl  | $SF \wedge OF$                       | Less (signed)             |
| setle | $(SF \wedge OF) \   \ ZF$            | Less or Equal (signed)    |
| seta  | $\sim CF \ \& \ \sim ZF$             | Above (unsigned)          |
| setb  | CF                                   | Below (unsigned)          |

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

# Example: setl (Signed <)

## ■ Condition: $SF \wedge OF$

| SF | OF | $SF \wedge OF$ | Implication                                           |
|----|----|----------------|-------------------------------------------------------|
| 0  | 0  | 0              | No overflow, so SF implies not <                      |
| 1  | 0  | 1              | No overflow, so SF implies <                          |
| 0  | 1  | 1              | Overflow, so SF implies negative overflow, i.e. <     |
| 1  | 1  | 0              | Overflow, so SF implies positive overflow, i.e. not < |

Add WeChat powcoder

negative overflow case

Add WeChat powcoder

- Can reference low-order byte

# Explicit Reading Condition Codes (Cont.)

## ■ SetX Instructions:

- Set single byte based on combination of condition codes

## ■ One of addressable byte registers

- Does not alter remaining bytes
- Typically use `movzbl` to finish job
- 32-bit instructions also set upper 32 bits to 0

```
int gt (long x, long y)
{
 return x > y;
}
```

| Register          | Use(s)            |
|-------------------|-------------------|
| <code>%rdi</code> | Argument <b>x</b> |
| <code>%rsi</code> | Argument <b>y</b> |
| <code>%rax</code> | Return value      |

```
cmpq %rsi, %rdi # Compare x:y
setg %al # Set when >
movzbl %al, %eax # Zero rest of %rax
ret
```

# Explicit Reading Condition Codes (Cont.)

Beware weirdness `movzbl` (and others)

`movzbl %al, %eax`

Zapped to all 0's

# Expressing with Goto Code

- C allows goto statement
- Jump to position designated by label

```
long absdiff
(long x, long y)
{
 long result;
 if (x > y)
 result = x-y;
 else
 result = y-x;
 return result;
}
```

```
long absdiff_j
(long x, long y)
{
 long result;
 int ntest = (x <= y);
 if (ntest) goto Else;
 result = x-y;
 goto Done;
Else:
 result = y-x;
Done:
 return result;
}
```

Add WeChat powcoder

# General Conditional Expression Translation (Using Branches)

## C Code

```
val = Test ? Then_Expr : Else_Expr;
```

```
val = x > y ? x - y : y - x;
```

Assignment Project Exam Help

<https://powcoder.com>

## Goto Version

```
n_test = !Test;
if (n_test) goto Else;
val = Then_Expr;
goto Done;
Else:
 val = Else_Expr;
Done:
 . . .
```

Add WeChat powcoder

- Create separate code regions for then & else expressions
- Execute appropriate one

# Using Conditional Moves

## ■ Conditional Move Instructions

- Instruction supports:

if (Test) Dest  $\leftarrow$  Src

- Supported in post-1995 x86 processors
- GCC tries to use them
  - But, only when known to be safe

### C Code

```
val = Test
 ? Then_Expr
 : Else_Expr;
```

### Goto Version

```
result = Then_Expr;
eval = Else_Expr;
nt = !Test;
if (nt) result = eval;
return result;
```

## ■ Why?

- Branches are very disruptive to instruction flow through pipelines
- Conditional moves do not require control transfer

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

# Conditional Move Example

```

long absdiff
(long x, long y)
{
 long result;
 if (x > y)
 result = x - y;
 else
 result = y - x;
 return result;
}

```

| Register | Use(s)            |
|----------|-------------------|
| %rdi     | Argument <b>x</b> |
| %rsi     | Argument <b>y</b> |
| %rax     | Return value      |

absdiff:

```

movq %rdi, %rax # x
subq %rsi, %rax # result = x-y
movq %rsi, %rdx
subq %rdi, %rdx # eval = y-x
cmpq %rsi, %rdi # x:y
cmovle %rdx, %rax # if <=, result = eval
ret

```

When is  
this bad?

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

# Bad Cases for Conditional Move

## Expensive Computations

```
val = Test(x) ? Hard1(x) : Hard2(x);
```

Bad Performance

- Both values get computed
- Only makes sense when computations are very simple

## Risky Computations

```
val = p ? *p : 0;
```

- Both values get computed
- May have undesirable effects

Unsafe

## Computations with side effects

```
val = x > 0 ? x*=7 : x+=3;
```

- Both values get computed
- Must be side-effect free

Illegal

# “Do-While” Loop Example

## C Code

```
long pcount_do
(unsigned long x) {
 long result = 0;
 do {
 result += x & 0x1;
 x >>= 1;
 } while (x);
 return result;
}
```

## Goto Version

```
long pcount_goto
(unsigned long x) {
 long result = 0;
loop:
 result += x & 0x1;
 x >>= 1;
 if(x) goto loop;
 return result;
}
```

- Count number of 1's in argument *x* (“popcount”)
- Use conditional branch to either continue looping or to exit loop

<https://powcoder.com>

Add WeChat powcoder

# General “While” Translation #1

- “Jump-to-middle” translation
- Used with -Og

## While version

```
while (Test)
 Body
```

## Goto Version

```
goto test;
loop:
 Body
test:
 if (Test)
 goto loop;
done:
```

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

# While Loop Example #1

## C Code

```
long pcount_while
(unsigned long x) {
 long result = 0;
 while (x) {
 result += x & 0x1;
 x >>= 1;
 }
 return result;
}
```

## Jump to Middle

```
long pcount_goto_jtm
(unsigned long x) {
 long result = 0;
 goto test;
loop:
 result += x & 0x1;
 x >>= 1;
test:
 if(x) goto loop;
 return result;
}
```

- Compare to do-while version of function
- Initial goto starts loop at test

Assignment Project Exam Help  
<https://powcoder.com>  
Add WeChat powcoder

# General “While” Translation #2

## While version

```
while (Test)
 Body
```

■ “Do-while” conversion

■ Used with -O1

Assignment Project Exam Help

<https://powcoder.com>

## Goto Version

## Do-While Version

```
if (!Test)
 goto done;
do
 Body
 while (Test);
done:
```

Add WeChat powcoder

```
if (!Test)
 goto done;
loop:
 Body
 if (Test)
 goto loop;
done:
```

# While Loop Example #2

## C Code

```
long pcount_while
(unsigned long x) {
 long result = 0;
 while (x) {
 result += x & 0x1;
 x >>= 1;
 }
 return result;
}
```

## Do-While Version

```
long pcount_goto_dw
(unsigned long x) {
 long result = 0;
 if (!x) goto done;
loop:
 result += x & 0x1;
 x >>= 1;
 if (x) goto loop;
done:
 return result;
}
```

- Initial conditional guards entrance to loop
- Compare to do-while version of function
  - Removes jump to middle. When is this good or bad?

# Assembly Setup Explanation

## ■ Table Structure

- Each target requires 8 bytes
- Base address at `.L4`

## Jump table

```
.section .rodata
.align 8
.L4:
.quad .L8 # x = 0
.quad .L3 # x = 1
.quad .L5 # x = 2
.quad .L9 # x = 3
.quad .L8 # x = 4
.quad .L7 # x = 5
.quad .L7 # x = 6
```

## ■ Jumping

- **Direct:** `jmp .L8`
- Jump target is denoted by label `.L8`
- **Indirect:** `jmp *.L4(,%rdi,8)`
- Start of jump table: `.L4`
- Must scale by factor of 8 (addresses are 8 bytes)
- Fetch target from effective Address `.L4 + x*8`
  - Only for  $0 \leq x \leq 6$
